Abstract - Rainfall Prediction in Indonesia is very important for agricultural sector. However, obtaining an accurate prediction is difficult as there are too many input parameters including the world climate change that affect the accuracy. An accurate prediction is required to arrange a good schedule for planting agricultural commodities. A good approach is required to obtain a good model as well as the accurate prediction. This paper proposes Tsukamoto fuzzy inference system (FIS) to solve the problem. An intensive effort is put in building fuzzy membership function based on rainfall data in Tengger region from ten years ago. A series of numerical experiments prove that the proposed approach produces better results comparable to those achieved by other approach. In Tutur region Tsukamoto fuzzy inference system obtain Root Mean Square Error (RMSE) of 8.64, it is better than GSTAR-SUR method that obtain RMSE of 10.89.

Keywords – Prediction, Rainfall, Tsukamoto Fuzzy Inference Systems, Tengger

I. INTRODUCTION

Indonesia is a country with two seasons, there are dry season and rainy season. Today, the rainfall in the rainy season is increasingly difficult to predicted. This is because of the world climate change that also affect for climate in Indonesia. Prediction of rainfall in Indonesia becomes very important for many sectors that use rainfall as an input parameter for decision making process. The sectors include the agricultural sector, the transportation sector such as maritime transportation and air transportation [1]. An accurate prediction in early can give farmers more time to take decision regarding water supply for their land. However, rainfall prediction is still a challenging task as there are too many input parameters that increase the difficulty level of building a mathematical model of the problem.

The importance of rainfall prediction in an unarguable as Indonesia is an archipelago with a lot of people working in agriculture sector. One of the agricultural area in Indonesia is Tengger, East Java. In Tengger area there are many farms of potato where potato agriculture is a sector who received the direct impact of changes in rainfall patterns [2]. This happens because the process of planting potatoes is highly dependent on rainfall so that crops could be at a maximum. Currently the potato is one of the agricultural products that can be used as a substitute for the main staple food in Indonesia [3]. However, due to the uncertain climate conditions, the productivity of potato in recent years become less than the maximum [4]. Therefore, predictions about rainfall to be one important factor in this sector.

The importance of rainfall prediction is showed in several researches. For example, Charaniya and Dudul [5] implemented Artificial Neural Network (ANN) to predict rainfall based on preceding six days rainfall. ANN also was used in a study by Vamsidhar et al. [6]. Whilst the studies reported promising results, a series of experiments were required to get the best architecture for their ANN. A simpler approach may be developed using fuzzy inference systems (FIS), one of them is Tsukamoto FIS. Tsukamoto FIS describe the relationship between inputs and outputs of the system using a set of fuzzy if-then rules. The main strength of fuzzy inference systems (FIS) are in their ability to conclude a complex issue purely from the data. Additionally, fuzzy inference systems (FIS) represent knowledge in a way that can be easily interpreted by humans. Fuzzy is a very flexible tool for architectural modeling and inference mechanism can be adapted to the given problem [7].

Fuzzy method has also been used to predict rainfall with the combination of Artificial Neural Network (ANN) which is used for prediction of rainfall in Brazil [8]. Besides other methods such as Sugeno fuzzy inference system has also been used as a method for modeling forecasting precipitation [7]. In addition, rainfall in the area Tengger, East Java has also been predicted using algorithms GSTAR-SUR Model with rainfall data in the previous year, but the RMSE from the prediction result is still large [4].

This research is aimed to make the simple method for rainfall prediction using Tsukamoto fuzzy inference system. The data for prediction criteria is rainfall data from 10 days ago, rainfall data from 20 days ago, rainfall data from 170 days ago, and rainfall data from 340 days ago. The data used is multiple of 10 days, because the data obtained for data rainfall per 10 days. By using rainfall data at an earlier time, it is expected Tsukamoto Fuzzy method can predict rainfall with predictions more accurate results with fewer error rates.
II. MATERIAL AND METHOD

A. Problem Formulation

Before calculating the fuzzy inference system, the data necessary to determine in advance the range of values that will be the criteria for rainfall prediction data. Based on the data obtained, each rainfall made the range of values shown in Table 1.

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Range of Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>$Z_{t-1}$</td>
<td>0.00 - 40.00</td>
</tr>
<tr>
<td>$Z_{t-2}$</td>
<td>0.00 - 40.00</td>
</tr>
<tr>
<td>$Z_{t-17}$</td>
<td>0.00 - 40.00</td>
</tr>
<tr>
<td>$Z_{t-34}$</td>
<td>0.00 - 40.00</td>
</tr>
</tbody>
</table>

Table 2 below presents data taken from observation stations in the Tutur region, Tengger, East Java which will be used as input values for each criteria. Predictions will be made with 326 test data.

<table>

B. Fuzzy Association

Fuzzy sets can be defined as an entity that represents a certain situation in a fuzzy variable [9]. In this study, use of fuzzy sets with two linguistic values, low and high. Formation of fuzzy set is adapted to input the data of rainfall. Linguistic values combined with fuzzy sets, each of which has a membership function that has been defined [10]. Data fuzzy sets and linguistic values are presented in Table 3.

<table>
<thead>
<tr>
<th>Fuzzy Association</th>
<th>Value Linguistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>$Z_{t-1}$</td>
<td>Low</td>
</tr>
<tr>

<td>High</td>
</tr>
<tr>
<td>$Z_{t-17}$</td>
<td>Low</td>
</tr>
<tr>
<td>$Z_{t-34}$</td>
<td>High</td>
</tr>
</tbody>
</table>

C. Fuzzification

Fuzzification process is a crisp value calculations or input values into degrees of membership. Fuzzification calculation process based on the boundaries of the membership functions [11]. The membership function of fuzzy sets with 4 input criteria was show in Fig. 1 to Fig 5.

Fig. 1. Membership Function Boundaries for $Z_{t-1}$

Low degree of membership:

$$
\mu_{Z_{t-1}\,Low}(x) = \begin{cases} 
1 & ; x \leq 10 \\
\frac{30-x}{10} & ; 10 < x < 30 \\
0 & ; x \geq 30
\end{cases}
$$

High Degree of Membership:

$$
\mu_{Z_{t-1}\,High}(x) = \begin{cases} 
1 & ; x \geq 30 \\
\frac{x-10}{30-10} & ; 10 < x < 30 \\
0 & ; x \leq 10
\end{cases}
$$

Fig. 2. Membership Function Boundaries for $Z_{t-2}$
Low degree of membership:

\[ \mu_{Zt\text{-17}\text{Low}}(x) = \begin{cases} 
1 & ; x \leq 10 \\
\frac{30 - x}{30 - 10} & ; 10 < x < 30 \\
0 & ; x \geq 30 
\end{cases} \]

High Degree of Membership:

\[ \mu_{Zt\text{-17}\text{High}}(x) = \begin{cases} 
1 & ; x \geq 30 \\
\frac{x - 10}{30 - 10} & ; 10 < x < 30 \\
0 & ; x \leq 10 
\end{cases} \]

Fig. 3. Membership Function Boundaries for Zt-17

Low degree of membership:

\[ \mu_{Zt\text{-34}\text{Low}}(x) = \begin{cases} 
1 & ; x \leq 10 \\
\frac{30 - x}{30 - 10} & ; 10 < x < 30 \\
0 & ; x \geq 30 
\end{cases} \]

High Degree of Membership:

\[ \mu_{Zt\text{-34}\text{High}}(x) = \begin{cases} 
1 & ; x \geq 30 \\
\frac{x - 10}{30 - 10} & ; 10 < x < 30 \\
0 & ; x \leq 10 
\end{cases} \]

Fig. 5. Membership Function Boundaries for Zt

Low degree of membership:

\[ \mu_{Zt\text{Low}}(x) = \begin{cases} 
1 & ; z \leq 10 \\
\frac{15 - x}{15 - 10} & ; 10 < z < 15 \\
0 & ; z \geq 30 
\end{cases} \]

Moderate Degree of Membership:

\[ \mu_{Zt\text{Moderate}}(x) = \begin{cases} 
1 & ; 15 < z < 25 \\
\frac{x - 10}{15 - 10} & ; 10 \leq z \leq 15 \\
0 & ; z \leq 10 \text{ atau } z \geq 30 
\end{cases} \]

High Degree of Membership:

\[ \mu_{Zt\text{High}}(x) = \begin{cases} 
1 & ; z \geq 30 \\
\frac{x - 25}{30 - 25} & ; 25 < z < 30 \\
0 & ; z \leq 25 
\end{cases} \]

D. Fuzzy Inference System

Fuzzy Inference System (FIS) is a system that performs a calculation based on the concept of fuzzy set theory, fuzzy rules, and the concept of fuzzy logic. In the fuzzy inference systems (FIS) are fuzzy input in the form of crisp values. The crisp value will be calculated based on the rules that have been made to produce the amount of fuzzy-called Fuzzification process.

Tsukamoto fuzzy inference system method of forming a rule base in the form of "causation" or "if-then". The first step in calculating the Tsukamoto FIS method is make a fuzzy rule.
The next step, calculated degree of membership in accordance with the rules that have been made. Once known the value of the degree of membership of each fuzzy rule, the value of alpha predicate can be determined by using fuzzy set operations [11]. Fuzzy rule base was shown in Table 4 and calculation of Tsukamoto fuzzy inference system was shown in Table 5.

</tr>
</tbody>
</table>

\[ Z = \frac{\sum(\alpha_i \cdot p_i \cdot z_i)}{\sum \alpha_i \cdot p_i} \quad (1) \]

Description:

- \( Z \) = the average defuzzification centralized
- \( \alpha_i \cdot p_i \) = alpha predicate value (minimum value of the degree of membership)
- \( Z_i \) = crisp values obtained from the results of inference
- \( i \) = number of fuzzy rules

### E. Defuzzification

The final step is the process of defuzzification where to find the value of output in the form of crisp values \((z)_i\). The method used in this process is a method Center Average Defuzzyfier. The method described in Equation 1 [11]. The result from defuzzification calculation process using Center Average Defuzzyfier method for data in Table V is 12.30642202.

\[ \text{RMSE} = \sqrt{\frac{1}{n} \sum_{i=1}^{n} (y'_i - y_i)^2} \quad (2) \]

Description:

- \( \text{RMSE} \) = Root Mean Squared Error
- \( y'_i \) = data from prediction
- \( y_i \) = the actual data
- \( n \) = number of data

### F. System Accuracy

To determine the level of accuracy of the prediction, the accuracy of the system were calculated using the formula RMSE (Root Mean Squared Error) expressed in Equation 2 [12].

### G. Deviation Formula

To calculate the degree of difference between the prediction results using Tsukamoto FIS and previous studies, we use deviation calculation formula. Deviation means the level of difference, where the formula is often used to evaluate the results of calculation [13]. Deviations in this study will be used to evaluate the results of rainfall prediction. The formula for calculating the deviation is shown in Equation 3.

\[ d = \frac{|e_1 - e_2|}{\text{Max}(e_1, e_2)} \quad (3) \]

Description:

- \( d \) = deviation
- \( e \) = error value

### III. RESULT AND DISCUSSION

In this research will be shown the results predicted in the four regions in Tengger, they are Puspo, Sumber, Tosari, and Tutur. Previous year rainfall data taken from four observation stations and will be used as input data for each criteria. From the input data will be obtained the results predicted rainfall in the next ten days or \(Z_t\) using calculation with Tsukamoto fuzzy inference system. The prediction results shown are predicted results 326 rainfall data in areas Tutur presented in Table 6.

### Table VI: Prediction Result with Tsukamoto FIS in Tutur Region

<table>
<thead>
<tr>

<td>12.36775</td>
</tr>
</tbody>
</table>
Results of prediction using the Tsukamoto fuzzy inference system is better when compared with the prediction results in previous studies that predict with GSTAR method [4]. It can be seen from the RMSE is smaller than previous. The following Table 7 displays a comparison RMSE from prediction results using Tsukamoto FIS and GSTAR in the four areas.

**Table VII**

<table>
<thead>
<tr>
<th>No.</th>
<th>Location</th>
<th>RMSE Fuzzy</th>
<th>RMSE GSTAR</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Puspo</td>

<td>0.206616</td>
</tr>
</tbody>
</table>

The deviation from the rate table can be seen that after the comparison at the level of deviation Puspo area is large enough. However, the prediction results in the area Sumber, Tosari and Tutur shows the level of deviation is small enough. This shows that the results predicted by Tsukamoto Fuzzy inference system has better accuracy. From Table 9 it can be seen that the RMSE results predicted in the area Puspo, Sumber, and Tosari with Tsukamoto fuzzy inference system have a worse result, but the difference is not too significant. In contrast to the results predicted in the Tutur area that shows RMSE is better than the last research. The difference of RMSE from Tsukamoto fuzzy inference system also not too far. This shows that the results predicted by Tsukamoto fuzzy inference system has better accuracy, although the error value obtained is greater than previous research. This result indicates that the Tsukamoto fuzzy inference system can predict rainfall and to overcome the greater error still needed optimization of fuzzy membership functions for next research. This research provide benefits in the agriculture sector for determine the rainfall, in particular determining the timing of planting potatoes in Tengger.

**IV. CONCLUSION**

This study proves that the Tsukamoto FIS can be used to forecast seasonal rainfall in the Tengger, East Java. By using rainfall data 10 days ago (Zt-1), rainfall data 20 days ago (Zt-2), rainfall data of 170 days ago (Zt-17), and the rainfall data of 340 days ago (Zt-34) obtained more accurate forecasting results. To calculate the accuracy rate formula used RMSE (Root Mean Squared Error). In this study, the largest RMSE is 9.64, and the smallest RMSE is 8.64. This study can be followed by an optimization of the fuzzy membership functions to obtain the prediction results with fewer errors. The optimization can be done by using meta-heuristics algorithms that have been proven successfully implemented for complex problems [14].
